## Paper 5 Practical Test

May/June 2022

**1 hour 15 minutes**

You must answer on the question paper.

You will need: The materials and apparatus listed in the confidential instructions

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [ ].
- Notes for use in qualitative analysis are provided in the question paper.

| For Examiner's Use |  |
|--------------------|--|
| <b>1</b>           |  |
| <b>2</b>           |  |
| <b>3</b>           |  |
| <b>Total</b>       |  |

This document has **12** pages. Any blank pages are indicated.

- 1 You are going to investigate the rate at which hydrogen gas is made when magnesium reacts with two different solutions of dilute hydrochloric acid, **C** and **D**, with different concentrations. The dilute hydrochloric acid is in excess in both experiments.

**Read all of the instructions carefully before starting the experiments.**

### Instructions

You are going to do two experiments using the apparatus shown.

#### (a) Experiment 1

- Use a measuring cylinder to pour 50 cm<sup>3</sup> of dilute hydrochloric acid **C** into a conical flask.
- Use a thermometer to measure the initial temperature of the dilute hydrochloric acid. Record the initial temperature in the space provided.
- Set the apparatus up as shown in the diagram, ensuring the inverted measuring cylinder is full of water.
- Remove the bung from the conical flask, leaving the delivery tube in the measuring cylinder.
- Add a coiled 5 cm length of magnesium ribbon to the conical flask, immediately replace the bung and start the timer.
- Measure the volume of gas collected in the inverted measuring cylinder every 20 seconds for 160 seconds. Record the volume of gas collected in the table.
- Use the thermometer to measure the final temperature of the dilute hydrochloric acid in the conical flask. Record the final temperature in the space provided.

initial temperature ..... °C

final temperature ..... °C

| time / s                                  | 20 | 40 | 60 | 80 | 100 | 120 | 140 | 160 |
|-------------------------------------------|----|----|----|----|-----|-----|-----|-----|
| volume of gas collected / cm <sup>3</sup> |    |    |    |    |     |     |     |     |

[2]

#### (b) Experiment 2

- Empty and rinse the conical flask with distilled water.
- Repeat Experiment 1 using 50 cm<sup>3</sup> of dilute hydrochloric acid **D** instead of dilute hydrochloric acid **C**.

initial temperature ..... °C

final temperature ..... °C

| time / s                                  | 20 | 40 | 60 | 80 | 100 | 120 | 140 | 160 |
|-------------------------------------------|----|----|----|----|-----|-----|-----|-----|
| volume of gas collected / cm <sup>3</sup> |    |    |    |    |     |     |     |     |

[3]

- (c) Complete a suitable scale on the  $y$ -axis and plot your results from Experiments 1 and 2 on the grid.

Draw **two** smooth line graphs. The lines must pass through (0,0). Clearly label your lines.

[5]

- (d) **From your graph**, deduce the volume of gas that was collected after 50 seconds in Experiment 2.

Show clearly **on the grid** how you worked out your answer.

volume of gas = ..... [3]

- (e) Explain what can be deduced about the concentrations of dilute hydrochloric acid **C** and dilute hydrochloric acid **D**.

.....  
 .....  
 .....  
 ..... [2]

- (f) (i) State what happens to the temperature of the dilute hydrochloric acid during Experiment 1.

..... [1]

- (ii) State what effect this temperature change has on the total volume of gas made when the reaction has finished.

..... [1]

- (iii) Describe a change that can be made to the apparatus or reagents to reduce the temperature change of the acid in Experiment 1.

..... [1]

- (g) Suggest why it is important to replace the bung in the conical flask immediately after adding the magnesium ribbon.

.....  
 ..... [1]

- (h) State the advantage of measuring the volume of gas collected every 10 seconds rather than every 20 seconds.

..... [1]

[Total: 20]

- 2 You are provided with two substances, solid **E** and solution **F**.  
Do the following tests, recording all of your observations at each stage.

**tests on solid E**

Add about 15 cm<sup>3</sup> of distilled water to the boiling tube containing solid **E**. Replace the stopper in the boiling tube and shake the boiling tube to dissolve solid **E** and form solution **E**. Divide solution **E** into three approximately equal portions in one boiling tube and two test-tubes.

- (a) To the first portion of solution **E** in the boiling tube, add aqueous sodium hydroxide dropwise until it is in excess.

**Keep the mixture formed for (b).**

Record your observations.

.....  
..... [2]

- (b) Gently warm the mixture formed in (a). Test any gas produced and identify the gas.  
Record your observations.

.....  
.....  
identity of gas ..... [2]

- (c) To the second portion of solution **E** add about 1 cm depth of dilute nitric acid followed by a few drops of aqueous silver nitrate.  
Record your observations.

..... [1]

- (d) To the third portion of solution **E** add about 1 cm depth of dilute nitric acid followed by a few drops of aqueous barium nitrate.  
Record your observations.

..... [1]

- (e) Identify the **three** ions in solution **E**.

.....  
.....  
..... [3]

**tests on solution F**

Divide solution **F** into two approximately equal portions in two test-tubes.

(f) Test the pH of the first portion of solution **F**.

pH = ..... [1]

(g) Add the second portion of solution **F** to the boiling tube containing solid sodium carbonate. Test any gas produced.  
Record your observations.

.....  
.....  
..... [3]

(h) Identify the positive ion in solution **F**.

..... [1]

[Total: 14]

- 3** A sample of muddy river water contains water, dissolved solids and insoluble solid mud.

Plan an investigation to find the concentration of dissolved solids, in  $\text{g/dm}^3$ , in the river water.

In your answer state how you will work out the concentration of the **dissolved** solids in g/dm<sup>3</sup>.

You are provided with a small sample (less than 1 dm<sup>3</sup>) of muddy river water and common laboratory apparatus.

(1 dm<sup>3</sup> = 1000 cm<sup>3</sup>)

[6]

## Notes for use in qualitative analysis

### Tests for anions

| anion                                           | test                                                                                  | test result                                                                                               |
|-------------------------------------------------|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| carbonate ( $\text{CO}_3^{2-}$ )                | add dilute acid                                                                       | effervescence, carbon dioxide produced                                                                    |
| chloride ( $\text{Cl}^-$ )<br>[in solution]     | acidify with dilute nitric acid, then add aqueous silver nitrate                      | white ppt.                                                                                                |
| bromide ( $\text{Br}^-$ )<br>[in solution]      | acidify with dilute nitric acid, then add aqueous silver nitrate                      | cream ppt.                                                                                                |
| iodide ( $\text{I}^-$ )<br>[in solution]        | acidify with dilute nitric acid, then add aqueous silver nitrate                      | yellow ppt.                                                                                               |
| nitrate ( $\text{NO}_3^-$ )<br>[in solution]    | add aqueous sodium hydroxide, then aluminium foil; warm carefully                     | ammonia produced                                                                                          |
| sulfate ( $\text{SO}_4^{2-}$ )<br>[in solution] | acidify, then add aqueous barium nitrate                                              | white ppt.                                                                                                |
| sulfite ( $\text{SO}_3^{2-}$ )                  | add dilute hydrochloric acid, warm gently and test for the presence of sulfur dioxide | sulfur dioxide produced<br>will turn acidified aqueous potassium manganate(VII) from purple to colourless |

### Tests for aqueous cations

| cation                             | effect of aqueous sodium hydroxide                          | effect of aqueous ammonia                                       |
|------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------|
| aluminium ( $\text{Al}^{3+}$ )     | white ppt., soluble in excess, giving a colourless solution | white ppt., insoluble in excess                                 |
| ammonium ( $\text{NH}_4^+$ )       | ammonia produced on warming                                 | —                                                               |
| calcium ( $\text{Ca}^{2+}$ )       | white ppt., insoluble in excess                             | no ppt., or very slight white ppt.                              |
| chromium(III) ( $\text{Cr}^{3+}$ ) | green ppt., soluble in excess                               | grey-green ppt., insoluble in excess                            |
| copper(II) ( $\text{Cu}^{2+}$ )    | light blue ppt., insoluble in excess                        | light blue ppt., soluble in excess, giving a dark blue solution |
| iron(II) ( $\text{Fe}^{2+}$ )      | green ppt., insoluble in excess                             | green ppt., insoluble in excess                                 |
| iron(III) ( $\text{Fe}^{3+}$ )     | red-brown ppt., insoluble in excess                         | red-brown ppt., insoluble in excess                             |
| zinc ( $\text{Zn}^{2+}$ )          | white ppt., soluble in excess, giving a colourless solution | white ppt., soluble in excess, giving a colourless solution     |

**Tests for gases**

| gas                               | test and test result                                                       |
|-----------------------------------|----------------------------------------------------------------------------|
| ammonia (NH <sub>3</sub> )        | turns damp red litmus paper blue                                           |
| carbon dioxide (CO <sub>2</sub> ) | turns limewater milky                                                      |
| chlorine (Cl <sub>2</sub> )       | bleaches damp litmus paper                                                 |
| hydrogen (H <sub>2</sub> )        | 'pops' with a lighted splint                                               |
| oxygen (O <sub>2</sub> )          | relights a glowing splint                                                  |
| sulfur dioxide (SO <sub>2</sub> ) | turns acidified aqueous potassium manganate(VII) from purple to colourless |

**Flame tests for metal ions**

| metal ion                      | flame colour |
|--------------------------------|--------------|
| lithium (Li <sup>+</sup> )     | red          |
| sodium (Na <sup>+</sup> )      | yellow       |
| potassium (K <sup>+</sup> )    | lilac        |
| copper(II) (Cu <sup>2+</sup> ) | blue-green   |
